Description

After recent changes I observe that open-stack deployment scripts do not allow to create and set up new virtual machine. Seems that problem occurred after the feature related to terminal jobs executions was released. The updating scenario seems still to be working.

I fixed the issue in [e5212a58](#) to master. Indeed, it is nice that the previously used approach to populate database was broken, since in particular this clearly shows that one has to use dedicated *manage.py* tasks for that.
